Epistemology models Ontology
Natural Selection Fails

Filter #1: Mutations are extremely high (over 100 mutations per generation). Regardless of the problems associated with the other filters, mutations are pouring into the system at a much faster rate than can be filtered out.

Filter #2: Most mutations have harmful effects. The biological system cannot tolerate them.

Filter #3: Genes are passed on randomly. It is highly unlikely that the same gene will be inherited.

Filter #4: The genes that are passed on are those that have the greatest impact. Natural selection filters out the less advantageous genes.
